阿根廷为若干冰箱和冰柜制订新能源效益规定(英文版)

Argentinean authorities recently issued a regulation (Resolution 198/2011) that implements new minimum energy efficiency standards for household front-opening freezers, top-opening (chest-type) freezers, fridges and freezers with more than two doors, and other miscellaneous refrigeration appliances. Covered fridges and freezers will have to comply with the Class C efficiency requirements of standard IRAM 2404-3:1998 effective from 1 September. According to Argentina's Department of Energy, Class C fridges and freezers consume at least 10 to 25 percent less energy than Class D fridges and freezers. Argentina has been requiring household fridges and fridges/freezers other than those covered by the current action to comply with the Class C efficiency requirements of standard IRAM 2404-3:1998 since 2009.
